Sometimes these network environments have software that can be accessed or updated remotely. In this scenario, users are being asked to have a tool installed that allows them to remotely install Windows XP Home Edition on other PCs within the network. This tool is referred to as a Remote Management Console, or a RemotePC applet. It is common for Windows OS administrators to send out an e-mail to a large number of users asking them to open a Web browser and run this tool to update their Windows XP computers. In fact, you can also get this tool to run in both Windows NT and Windows 2000 mode, which you should know will allow you to install, test, and update the remote PC with a complete Windows XP installation with no additional work. The applet requires just a few minutes of your time to complete the installation process, but it should take longer than that to actually configure the remote PC. XP Home Enabler will inform you of any errors and perform them before it starts to configure your remote PC. The first thing you will notice is the fact that the program's interface is quite easy to use. However, the tool is a bit different than most other Windows management tools. For instance, it doesn't have a menu bar, nor does it have a built-in file
